A B S T R A C T

The report describes a file structure which combines list-processing concepts (for handling variable length information records) with standard serial record arrangements (for identification information). The file organization was designed for a large chemical information system and includes both well-structured and unstructured (amorphous) information. An investigation was made of representative data inputs from the Department of the Army. The data to be put into the file, the nature of the file structure, and the necessary programs for manipulation of file information have been considered as interdependent parts of a total system. Computer programs have been initiated to test the validity of the proposed approach.

FILE ORGANIZATION FOR A LARGE CHEMICAL INFORMATION SYSTEM

by Anderson, Marden, and Marron

1. INTRODUCTION

This report covers the activity sponsored by the Army Research Office in File Organization for a large chemical information system. Initial investigations were concerned with exploration of file organization research undertaken by others in an effort to determine whether techniques developed for different situations could be applied to the organization and manipulation of chemical information. Samples of CIDS "hard-core" data were obtained from various laboratories and a procedure for organizing files of this information was devised. This procedure combines the features of a fixed-length sequential master record file with those of a variable-length non-sequential data file strung together in a list-processing fashion. Present work includes programs for file creation, updating and expansion. Future plans include the creation of sub-files and the querying of the files.

2. OBJECTIVES

The project has been concerned with two considerations; long-range objectives and short-term goals.

The long-range objectives are:

1. To define some of the characteristics of large files, and to develop the structure for a large file of heterogeneous scientific and technical information including chemical structure representations,

with particular attention to the necessity for:

- a. Manipulating information which is in some cases formatted and in others completely amorphous.
 - b. Making provision for inclusion of certain kinds of information when it exists, and for later filling of gaps when the information is not available at the time of file initiation.
 - c. Creating a multi-level file of information so that provision may be made for the inclusion of generic information, as well as the addition of various levels of specificity as required by the user, either simply because the additional levels of specificity exist and might be useful at a later date or because there is a user requirement for that degree of specificity.
 - d. To examine the inter-structuring of files that are part of the larger files but which may be geographically separated.
2. To provide list-processing capability in the file structure in order to:
- a. Maintain flexibility in the file.
 - b. Provide for an efficient means of updating.
 - c. Permit additions to files, both in classes existing already within the system and in the entry of new classes of information.
 - d. Free the system from the constraints of fixed-length and formatted files.
 - e. Permit aggregations of data from files that are geographically separated.

3. To investigate the techniques of file manipulation in order to provide systems of sub-files, special files, desirable redundancy in exchange for multiple access to information, and the necessary keying or cross-referencing facility required for such a system of multi-level, multi-subject files. This work must take into account also the planning and development of the several kinds of computer programs which are required for file maintenance. (This report presupposes that all such file manipulation will be carried out by computers.)
4. To determine the kind of organization of information which will most readily permit questioning of the file by different groups of questioners who have varied (and varying) requirements for the kinds of information contained in the file, and who have, furthermore, requirements for differing degrees of specificity in the information they are seeking.

The short-term goals are concerned with attempting to satisfy the following immediate requirements:

1. To store specific categories of well-defined data in a computer.
2. To devise procedures for questioning the file and retrieving information from it.
3. To employ computer search programs on a limited basis to test the validity of the approaches.

3. BACKGROUND STUDIES

Theoretical studies and actual implementations of files developed by others were investigated with a view toward incorporating those approaches deemed applicable to large chemical information systems. All of the file organizations studied were designed for structuring information for automatic storage and retrieval, but were responsive to different requirements. The studies investigated included variations of list-processing techniques, hospital and clinical record keeping, and chemical structure files containing associated corollary information. (See Appendix A.)

The classical concept of a master file containing all known information for each entry in full detail was considered, but rejected because of its requirement for large amounts of space and because of its restraint on expansion in as yet unknown directions. Similarly, an investigation was made of the idea of a "Control File" or "File Relater and Locator System" which would consist of a separate file of identification numbers of entries and the names of the satellite files wherein information on these entries is located, together with the keys for addressing them. After consideration of the types of data to be included in a large chemical information file (see Section 4), it was decided as a first approach to devise a system incorporating the features of the two plans discussed above, i.e., a linear file consisting of basic fixed-field information about the entry, plus pointers to satellite information files.

4. TEST DATA

The U.S. Army (see Appendix A-1) lists the following eight types of information to be included for each compound in their chemical information and data system:

1. Registration or identification number
2. Chemical structure, probably a listing of atoms and bonds
3. Molecular formula
4. Bibliographic citations
5. Nomenclature including chemical names, linear notation, trade names, etc.
6. Location of data files information
7. Kinds of data and information available at each location
8. Security classification and releasability

One other item not listed is the source of the compound or material, that is the subject of the file entry.

The Army's file is designed to accommodate the entry of three million compounds. It should be noted that the above list includes both structured and unstructured information and that the list includes referrals to satellite files.

The Army was asked to supply sample data for the experimental attempts to structure the files, and in answer six organizations supplied sample forms which had been executed in accordance with a set of instructions supplied by the Army (see Appendix B). The major portion of the information was recorded on the CIDS Registry File - Hardcore Input Forms (SMUEA Form 13, 26 AUG 64). (See Appendix C.)

As might have been expected, there was considerable variation not only in the content of the information supplied on the sample forms, but in the completeness of the individual entries. Certain of the organizations employed forms of their own design rather than those shown in Appendix C. There were differences in interpretation among the various organizations as to what was desired by the Army for certain categories of information. All of the forms were incomplete in some respect, with some having little more than a structure diagram and the name of the reporting agency. Based on the use of the trial forms, and as noted in the Recommendations (see Section 7), additional effort should be expended on the design of forms and the development of instructions for completing them in order to promote greater consistency.

Personnel at Frankford Arsenal compiled a list of 1008 different categories of information in an attempt to identify all of the information requirements of the Department of the Army. This list will remain open-ended for the subsequent addition of new categories as need arises. Any one installation would not contain all of the elements of information which appear in the complete list. An analysis was made of the information received from the six sources listed in Appendix B, and it was found that the information supplied on the forms contained only a small number of the categories from the list compiled by Frankford Arsenal. No attempt was made to relate them directly to the Frankford list, but it was observed that the elements of data encountered on the forms tended to be formed into different classes rather than to comprise sub-sets of the Frankford listing. It can be assumed that the data reported responded to the requirements of the individual reporting agency.

For the sake of the experiment, it was desirable to treat all of the data

from the six reporting agencies in a uniform way. Therefore, the following composite list of all the data reported was formed; no one set of forms contained all of the categories, and some contained only a few.

1. Reporting agency
2. Security classification
3. Release restrictions
4. Local control number
5. Date
6. Registry number
7. Molecular formula
8. Nomenclature
9. Structure
10. Bibliographic references
11. Types of data
12. Key words

Notations (such as Wiswesser notation, Hayward notation, IUPAC cipher, etc.) were included under nomenclature. These should form a separate category since nomenclature also includes trivial names, trade names, chemical names, common names, and others. (See Recommendations, Section 7.) With respect to certain other categories of information, some forms merely listed the presence of information in that particular category, without supplying the actual information itself.

5. PROPOSED FILE ORGANIZATION

A tentative file organization to handle the categories of information contained on these forms is now under development. It will serve as an experimental model for the purpose of ascertaining from the proposed users its expected utility for their requirements.

The overall file system will consist of two parts:

1. A master-file of fixed length information,
2. Information-files of variable length information.

Further, the master file will contain keys to the location, size and type of pertinent entries in the information files.

Each record in the master-file will be assigned a unique identification (ID) number and each item in the information file will be tied to its master-file record by the ID number and will be identified by a "level code" to indicate its hierarchy in a two-dimensional chained-file arrangement. The following list of such categories was used as an experimental model, but is by no means an all-inclusive one. (Note assigned "level code" at right.)

Table 1

LIST OF FILE CONTENTS BY CATEGORY

Category _____

1. ID number
2. Reporting laboratory
3. Local control
4. Security
5. Date

<u>Category</u>	<u>Level Code</u>
6. Molecular formula	010000
7. Notations	020000
a. Hayward	021000
b. Wiswesser	022000
8. Nomenclature	030000
9. Types of data	040000
a. Physical properties	041000
b. Chemical properties	042000
c. Physiological effects	043000
1. Respiratory	043100
2. Cardiac	043200
3. Neuromuscular	043300
d. Toxicity	044000
1. Intravenous	044100
2. Intramuscular	044200
a. Rabbits	044210
b. Rats	044220
3. Oral	044300
10. Provision for supplementing categories in the above listing	

Table 2 is a machine word schematic for the fixed length master file record.

Table 2

SCHEMATIC FOR FIXED-LENGTH MASTER-FILE RECORD

Word no.

1	ID number	}	identification data
2	Reporting laboratory		
3	Local control number		
4	Security data		
5	Date		
6	Pointer to molecular formula record	}	pointers to information files
7	Pointer to notations record		
8	Pointer to nomenclature record		
9	Pointer to types of data record		
10	Unassigned		

The fixed-length master-file record will occupy 10 machine words. Words 1 through 5 consist of identification information. Words 6 through 10 are "pointer" words. They serve as indicators of the presence or absence in the information file of their respective categories of information with a key to location and length of record when presence is indicated.

A typical pointer-word consists of three fields: one field contains the level code for a particular category of information; the second field contains the address where that particular block of information can be found; the third field reveals the automatically-generated number of machine words of data contained in that information record. Certain addresses in this field of a pointer word imply special conditions about the referred to data. This will be illustrated with specific information shortly.

Pointer Word

level code	address	number of words
------------	---------	-----------------

Table 3 is a machine word schematic for a variable length information file record.

Table 3

SCHEMATIC FOR VARIABLE-LENGTH INFORMATION-FILE RECORD

Word no.

1	ID number	
2	Previous item	
3	Current item	
4	Next item in → direction (sub-class of current item)	} pointers
5	Next item in ↓ direction (parallel class to current item)	
6		
'		} information available in the category of the current item
'		
'		
N		

The variable-length information-file record contains five fixed words at the beginning of each record: the first word is the ID number (which is shown as word 1 in the master-file record in Table 2); the next four words are pointers; word #2 points backward to the previous item in the hierarchy of levels, word #3 identifies the current item and words #4 and #5 point forward

allowing a branching in two directions. The actual locations of the blocks of data are irrelevant, as long as the pointers link them correctly. The basic filing algorithm is the following: each information record filed is placed in a block whose address is in an index register called OPEN. This address becomes the address of the current item being filed and the index register is adjusted so it contains the address of the next OPEN block.

Let us consider a master-file record typical of those submitted, where information is given under each category listed in the data outline (table 1) except for nomenclature, level code 030000.

Table 4
TYPICAL MASTER-FILE RECORD

<u>Word no.</u>	<u>Contents</u>	<u>Explanation</u>
1	A0000007	ID number
2	001500	Reporting laboratory code
3	0006000	Local control number
4	000000	Security information
5	120764	Date
6	010000 MCLE 07	Molecular formula
7	020000 HAYW 03	Notations
8	000000 0000 00	Nomenclature
9	040000 DATA 09	Types of data
10	000000 0000 00	Provision for additional categories

Words 6, 7, and 9 indicate that information pertaining to their respective level-codes can be found at the named machine locations. For example,

word #6 indicates that seven words of information for level-code 010000 (molecular formula) can be found at location MOLE. Word #8 is zero, indication that there is no information in the file for level-code 030000 (nomenclature). Word #10 is blank indicating that no additional categories of information have been added to the master-file record.

Note how the above master-file arrangement leads itself to cursory scanning of "pointers" for the purpose of creating sub-files for each major category. Further illustrations will demonstrate that this facility for creating sub-files can be carried out quickly and efficiently at any given level in the file.

Let us now look at location MOLE for a typical Information File item.

Table 5

TYPICAL INFORMATION FILE RECORD-EXAMPLE 1

<u>Location</u>		<u>Contents</u>		<u>Explanation</u>
MOLE		A0000007		ID number
MOLE + 1		MASTER	} P O I N T E R S	Pointer to previous item
MOLE + 2	010000	MOLE 07		Current item
MOLE + 3	000000	0000 00		Next item →
MOLE + 4	000000	0000 00		Next item ↓
MOLE + 5 thru MOLE + 11		The molecular formula information		

Note from Table 1 that molecular formula is a one entry level. Therefore words MOLE+3 and MOLE+4 are pointer words of ZERO indicating the end of the chain. MASTER in MOLE+1 is a special symbol to point back to the master file. Since the master file will be sorted and rearranged,

it was decided not to use the original address in pointers back to the master file. Note that words at MOLE and MOLE+2 are identical with words 1 and 6 respectively in Table 4.

Now let us consider the representation of an information record in a more complex network such as intramuscular toxicity. (See Table 1, category 9.d.2, Level Code 044200.)

Table 6
TYPICAL INFORMATION FILE RECORD - EXAMPLE 2

<u>Location</u>		<u>Contents</u>		<u>Explanation</u>
INMUS		A0000007		ID number
INMUS+1	044100	INVEN 09	P O I N T E R S	Previous Item
INMUS+2	044200	INMUS 00		Current Item
INMUS+3	044210	RABB 05		Next Item →
INMUS+4	044300	ORAL 11		Next Item ↓

The zeros in the third field of INMUS+2 indicates that the current item is a stepping stone to items further on in the hierarchy. Here there is no general information on intramuscular toxicity, but there is information on intramuscular toxicity in rabbits located at RABB. Further there is information on oral toxicity located at ORAL.

Note that the level code of the next item → and the level code of the next item ↓ (here words INMUS+3 and INMUS+4) both can be converted to the level code of the current item when the following rule is applied: Starting from the right, decrease the first non-zero digit in the level code by one. This will prove useful in threading backwards in the hierarchy!

6. CURRENT STATUS

Information has been punched on 8-channel teletype tapes in ASCII (American Standard Code for Information Interchange) from the data mentioned earlier in this report. A program has been written for creating the master-file records from these data tapes. In addition several programs already operational are available from other projects for manipulating files. These programs, written for the NBS Chemical Structure Manipulation Projects, are as follows:

1. A system for a chemical structure or substructure search based on the Hayward notation.
2. A sort routine for sorting blocks of information on a specific key in the block.
3. A program for the derivation of molecular formulae and other structure-related screening information from the Hayward notation.

Programs are being written for transforming both Hayward and Wiswesser notations into connection tables of the same format. Generic structures of the Markush type and partially indeterminate structures will be interfaced with such connection tables. A program is also being written for a chemical structure search from the connection tables of both specific and Markush structures.

An executive routine is planned for the system which will include modules for file maintenance, creation of subfiles, and the exercise of certain control functions.

7. RECOMMENDATIONS

1. Find ways of representing in the automated files the unstructured information. This may require the development of a classification scheme for such information.
2. Make provision for indicating in the automated information file that additional information is available elsewhere, and indicate where it is located; e.g., microfilm files, hard-copy folders at the reporting laboratory, or other.
3. Design adequate forms for reporting information, along with a comprehensive set of instructions for proper recording of the information on the forms. Uniform reporting on standard forms will tend to promote greater consistency in the input data. This is an especially important consideration if a central file is to be built which will serve several agencies.
4. Amend the CIDS list of hard-core items to include notation as a separate item rather than as a part of nomenclature.
5. Continue the development of programs for entering information into the files and for searching the files.
6. Develop a package of software containing service routines and executive routines which will exercise control over file maintenance and selection of appropriate search routines for the file.

INSTRUCTIONS

1. **ORIGINATING ACTIVITY:** Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (*corporate author*) issuing the report.

2a. **REPORT SECURITY CLASSIFICATION:** Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. **GROUP:** Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. **REPORT TITLE:** Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. **DESCRIPTIVE NOTES:** If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. **AUTHOR(S):** Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. **REPORT DATE:** Enter the date of the report as day, month, year; or month, year. If more than one date appears on the report, use date of publication.

7a. **TOTAL NUMBER OF PAGES:** The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. **NUMBER OF REFERENCES:** Enter the total number of references cited in the report.

8a. **CONTRACT OR GRANT NUMBER:** If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, 8c, & 8d. **PROJECT NUMBER:** Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. **ORIGINATOR'S REPORT NUMBER(S):** Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. **OTHER REPORT NUMBER(S):** If the report has been assigned any other report numbers (*either by the originator or by the sponsor*), also enter this number(s).

10. **AVAILABILITY/LIMITATION NOTICES:** Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:

- (1) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. **SUPPLEMENTARY NOTES:** Use for additional explanatory notes.

12. **SPONSORING MILITARY ACTIVITY:** Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.

13. **ABSTRACT:** Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. **KEY WORDS:** Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
